IMPORTANT: This document contains 100% FREE gambling systems designed specifically for ROULETTE, and any casino game that involves even money bets such as BLACKJACK, CRAPS & POKER. Please note although these may be among the best FREE systems available, they do NOT beat the house edge. That means in the long term, like 99% of systems, they will lose. Beating the house edge is a very different thing. However, these free systems are excellent short term winners that can deliver a healthy profit. Systems that actually beat the house and win consistently are rare, but they do exist and enable you to earn a living by gambling. One such system is explained at www.genuinewinner.com

TABLE OF CONTENTS

ABOUT THE AUTHOR: My name is Stefano Hourmouzis. I have been developing gambling systems of all kinds for well over 12 years. Believe me I've tried virtually everything imaginable and have only found THREE legitimate ways that can realistically earn you a living through gambling: ROULETTE, BLACKJACK and SPORTS BETTING. However roulette is my game of choice because, despite popular belief, it is actually the most profitable casino game there is. My site at genuinewinner.com explains two methods roulette can be beaten.

ROULETTE – FREE System # 1

STEP 1 (Pre-Qualifying Bets):
Chart spins until 10 numbers spin without any repeats. Do not use numbers from any previous group of 10.

STEP 2 (First Bet):
On the 11th spin, bet one unit on the last 10 numbers to have spun.
IF YOU WIN, stop and go back to step 1.
IF YOU LOSE, go to step 3.

STEP 3 (Second Bet):
On the 12th spin, bet on the last 11 numbers to have spun.
IF YOU WIN, stop and go back to step 1.
IF YOU LOSE, go to step 4.

STEP 4 (Third Bet):
On the 13th spin, bet on the last 12 numbers to have spun.
IF YOU WIN, stop and go back to step 1.
IF YOU LOSE, keep charting until one of the numbers repeats since you began charting, then start with new numbers at step 1.

ACTUAL TEST RESULTS ARE AVAILABLE ON THE FOLLOWING PAGE

Below are simulation results for this system. In this example, the house edge appears beaten although with more spins, the system will lose. The system presented cost me almost $1,000, yet it still does not enable any player to earn a living playing roulette.

Unit Value	$ 2.00

WIN SIDE:

	Count	Units Saved	Win Prob.	Units Win	Lose Prob.	Units Lost
11s	51	0	1	1785.00	0	459
12s	44	0	1	1540.00	0.000	880
13s	29	0	1	1015.00	0	928
	124	0		4340.00		2267

LOSE SIDE:

	Count	Win Prob.	Units Win	Lose Prob.	Units Lost	
14 and over	61	0	0	1	2013	Lose Side
					2013	<< Loss

TOTALS:

			Win Side Profit	Bet Per Spin	Wagered
Win Side Profit	2073.00	<< Units	2073.00	10	510
Lose Side Loss	2013	<< Units		11	484
Overall Unit Profit	60.00	<< Units		12	348
Max Units Wagered	3355	$ 6,710.00			1342
Funds Needed to Play	(Safe Play)	$ 660.00			
Sessions Played	185				

Dollar Profit	$ 120.00
Player Edge	2%

ROULETTE – FREE System # 2

This system is a relatively safe progression betting system (increasing bets after losing). It is very time consuming but delivers good results. However, it still does NOT beat the house edge so over the long term, it will lose. The only way you can beat the house edge is if you know where the ball is most likely to land – you must know where and why, and it must relate to a real roulette wheel and ball. My main system does this as explained at www.genuinewinner.com

This system involves even money bets such as red and black. It can also be applied to any other game that enables even money bets.

REPEAT THIS PROCEDURE:

Bet one unit on red (or black) for 100 spins. If after the 100 spins:

1. You are up 10 or more units, stop playing and take winnings.
2. You are down 10 or more units, increase your bet by one unit and restart.
3. You are neither up nor down by 10 or more units, maintain the same bet.

100 spins is relatively short term. This system is good for winning in the short term (if you're a casual gambler, and not trying to earn a living with roulette) but still it does not tell you which numbers to bet on with any kind of immediate accuracy, so the house edge is still against you.

ALL EVEN MONEY GAMES – FREE System # 3

An even money game is where the payout odds are 1-1. In other words, if you wager $5, you profit $5 if you win. This particular system can be applied with any even money game. It is pure progression although you'll find it works quite well for a short-term strategy.

Procedures:

Bet 1 UNIT on any 1-1 odds bet. If you lose, increase your bet by 1 UNIT. If you win, decrease your bet by 1 UNIT unless you're already at your minimum bet (in this case your minimum bet is 1 UNIT).

If you reach 15 or more units per bet, reset and return to the start. BUT, instead of starting with 1 UNIT, start with 4 more units than your previous minimum bet. So if your previous minimum bet was 1 UNIT, now it is 5 UNITS. Alternatively, you could simply restart and revert back to 1 UNIT bets, but double your unit value. You will then continue to play until you have made a clear profit, THEN return to the original unit value.

You should set yourself a goal of around 10 units profit, then walk. You can easily profit more than this, but set conservative goals to avoid disappointment. But understand the house edge is not overcome so if you play on, you are guaranteed to eventually blow your bankroll.

How to know if a system will lose in the long-term, without even buying it

The below article will help you determine which systems are definitely INEFFECTIVE, and which at least have a chance of being genuine long term winners <u>without you even needing to purchase</u>

Almost every roulette player has purchased a roulette system from the internet only to find it fails miserably. Unfortunately, the internet is rampant with fraudulent and clearly ineffective gambling systems. While almost every system seller claims to offer the "only" truly effective roulette system, almost every known roulette system fails. With virtually every system seller claiming the same thing, how do you know if a roulette system is ineffective or genuinely effective without risking your money? The principles explained within this article will aid you to determine which roulette systems are almost definitely ineffective, and which are at least "possibly" a genuine winner.

PRINCIPLE 1: You can beat the roulette wheel, but not the betting table: Einstein himself once said, "You cannot beat a roulette table unless you steal money from it." Read his statement carefully. Most people assume he meant the game of roulette itself is unbeatable, but this is not the case. He made his statement about the table, not the game of roulette. While it's completely true you cannot beat a "roulette table", you certainly can beat a "roulette wheel", and therefore the game of roulette. Contrary to popular belief, roulette is indeed beatable - millions can and have been won but only with methods based on the wheel itself.

Although the betting table is a scattered representation of the wheel, they are certainly not the same thing. For example, consider the first dozen (numbers 1-12). Each of these twelve numbers are perfectly scattered throughout various sectors of the wheel. Similarly, other outside bets are not a representation of specific sectors. Understand the table is intentionally designed not to represent wheel sectors because the casinos know while you cannot predict any "outside bet" with enough accuracy to overcome the house edge, you can predict which sector of the wheel will spin with enough accuracy to overcome the house edge. Although some tables permit sector-based bets, on most roulette tables, the only way to cover a wheel sector is by placing bets on individual numbers (inside bets). It is a mathematic and scientific certainty. Once you understand this principle, you understand that any system based on outside bets simply cannot win over the long term. This knowledge alone will help you eliminate approximately half of the roulette systems for sale on the internet as a candidate for a genuine winner. You should only ever consider a roulette system based on wheel sectors, because it's the only way a system "can" be effective.

PRINCIPLE 2: You can only beat real wheels, not computer generated spins: One of the golden rules of marketing is people buy what they "want", not what they "need". In the case of roulette systems, most people want a system they can apply online, so that's what most system sellers offer. However, rather than using real wheels and balls, almost every online casino uses random number generators to determine winning numbers. Because there is no real wheel, absolutely no bet can ever represent a wheel sector, and therefore

no system can ever beat online casinos and computer generated spins – it's absolutely impossible. While this may not be what purchasers want to hear, it is the plain truth. The only exception is live online roulette where a real wheel is viewed by webcam (a list of such online casinos is shown at the right side of www.genuinewinner.com/main.htm)

PRINCIPLE 3: If a system fails with flat bets, it cannot succeed with progression bets (changing bet size after wins/losses): If 10 reds spun in a row, the odds that black will spin next are still less than 50%. In such a situation, would you bet on black thinking it's just bound to happen sooner or later? Perhaps this has happened to you, and after losing, you increased your bet to cover losses only to eventually blow your entire bankroll. This is one of the most common and fatal mistakes made by roulette players. It doesn't matter how fancy or intricate your progression bets are, whether they be increasing or decreasing bets after a win or loss, progression bets cannot increase your chance of winning in the long term. If you increase bets after losses, you will only either get lucky and win big, or increase the rate at which you blow your bankroll. If you decrease bets after losses, you just decrease the rate at which you blow your bankroll.

No matter what you bet on, unless your prediction is accurate enough, you cannot overcome the house edge. To understand exactly what the house edge is, consider the European wheel has 37 numbers. If you bet and win on a single number, you receive 36 units back (35 new units + 1 unit you bet with). In other words, the payout is less than what you would be entitled to if the odds between you and the casinos were equal. This is where the house edge comes from. It is important to understand this concept because once you do, you realise even when you win, you still actually lose.

Genuine long term winning systems and strategies do exist, but they do not contravene the above principles. By investigating whether or not a system contravenes the principles, you can eliminate the clear majority of systems for sale as potential genuine winners. Among the known effective techniques are roulette computers, visual ballistics and wheel analysis methods – each of which are based on real wheels only, sectors of wheels, and can win over the long term without any form of progression. However, a system that complies with the principles does not guarantee it is effective. In fact there are a number of known ineffective roulette computers and just plain impractical visual ballistics and wheel analysis methods.

Prospective buyers of roulette computers should be wary and insist upon personal demonstrations before buying, rather than just rely on a seller's claim that they can provide personal demonstrations. Alternatively, the buyer should insist upon clearly unedited video footage showing proof of effectiveness before buying. Some roulette computer sellers are known to use voiceovers (predictions) in video footage to give the illusion that their computer is effective. Despite the effectiveness of a correctly designed computer, readers should be advised such electronic devices are illegal to apply for monetary gain in some jurisdictions, and thus should only be used for evaluation purposes.

With regards to visual ballistics and wheel analysis methods, the buyer should still insist upon undeniable proof. If the seller cannot provide proof of effectiveness such as a freely downloadable and clearly unedited video footage, be wary because when something is legitimately effective, it can easily be proven. Never rely on the word alone of a seller.

Can the casinos really be beaten?

Some may argue if the casinos could be beaten, then they wouldn't be in business. But the truth is they certainly can be beaten, although there are far more losers than there are winners. And IF the casinos find consistent winners, they can easily and legally ban them – plain and simple. As long as this is always the case, the casinos will remain in business.

Surely you've heard of this happening with blackjack card counters who beat the casinos consistently. This can still be done although most casinos have made changes that make such strategies very difficult to apply without the aid of computers.

Electronic gadgets are illegal in a lot of casinos, but still legal in many. You may have also heard of various electronic gadgets being used the beat roulette and win millions (news articles on my site).

So can casinos really be beaten? Yes they certainly can. But can they be beaten without any special skills or the use of potentially illegal computers? Absolutely! Although very rare, genuine and long-term winning gambling systems DO exist. You never hear about them because people that have them usually want to keep their secret. I've only ever purchased two systems that actually beat the house edge, although one is impractical, and the other is not mechanical so guesswork is required which can be quite stressful.

Which casino game is the most profitable, and why?

You don't need to spend much time in a casino to see the amount of money that is exchanged. In seconds, you can see thousands of dollars come and go on one table alone. Many years ago when I first saw this, I was inspired to develop a winning gambling system. Because I knew IF it could be achieved, I would have a virtually limitless tax-free income for life. You've probably requested this information because you have the same thing in mind.

For well over a decade, I've developed, purchased and tested virtually every gambling system and concept for BLACKJACK, CRAPS, ROULETTE, SLOT MACHINES, SPORTS BETTING and more. Whether or not it's what you want to hear, I found that the only realistic avenues for earning a living through gambling are BLACKJACK, SPORTS BETTING and ROULETTE.

Here's what I found for each game/avenue:

BLACKJACK: Cards are drawn from a deck so you can count cards. This is nothing new, although many casinos have made changes to the game that make counting more difficult. If you know how, you can overcome them and still earn a living with blackjack. With $25 units, you can realistically earn around $800 per day. But it requires a lot of practice, patience and skill. Alternatively, you can use card counting equipment and software. I purchased various software packages although only one did what it promised.

CRAPS: Unless you're doing most of the rolling, the house edge can't be overcome. No betting system or strategy can ever beat this game in the long term. Your only hope is to develop a short term strategy and walk with the profits. But if you play long enough, eventually you will lose your entire bankroll, so you can never earn a living playing craps.

ROULETTE: This is traditionally known as the suckers game – a pure game of chance. I initially believed this too and focused my efforts on blackjack. But I came to find roulette is in fact beatable, and the most profitable game there is. I was first made aware of the possibilities of beating roulette when I heard a gambler was caught using an electronic device to predict where the ball will land. He made a lot of money in a very short period of time, and a lot more than what could be done with any other casino game, including blackjack. The thing to understand is roulette is not random. When you see the ball bounce around, it looks unpredictable but you are looking at only one spin, not many. And over many spins, patterns occur because the physical properties and features of the wheel are fixed and do not change. It took years, but I perfected a way to predict where the ball will land, not with perfect accuracy, but more than enough accuracy to beat the house edge. And believe it or not, unlike with the roulette computers, you bet BEFORE the ball is spun.

SLOT MACHINES: If you play random slot machines, it is pure suicide. Your only hopes are to apply a short term strategy and walk when you're up, or monitor specific machines and their respective payouts to find discrepancies as some casinos have higher payouts for machines that are most visible. And often new machines payout more as a form of promotion. However, what one casino or slot machine does is impossible to determine unless you actually know a casino employee or do a lot of research that is not guaranteed to pay off.

SPORTS BETTING: You can place sports bets in most of the larger casinos, or even at home on the Internet. If you're good and know your sports, you can earn a reasonable living with regular betting. But you have to first overcome the bookies edge against you, then correctly predict the outcomes of sporting events more often than others. I'm not a fanatical sports fan and found it too time consuming to research information that was required to generate a significant income. However, I discovered a loophole whereby profits can be 100% guaranteed for every event you bet on. To put it simply, you place bets on the same sporting event but with different bookies. And as the bookies offer different odds, you can be 100% assured you will walk away with a profit. It is easy to do and you can purchase some instructional guides on the Internet, although most of the information is out-dated and common knowledge. And because it's common knowledge, the profits are not that great. If you are to actually earn a living with sports betting, rather than earn just a small income boost, the main thing is selecting the right bookies and knowing where and how to bet. I plan to be offering this information some time in the future.

POKER: There are many variations of poker. It is a classic game and one of my favorites to play. It can be beaten, but the methods are very impractical to apply and the edge is so slight that even a losing streak could blow your bankroll.

See my main system at www.genuinewinner.com – I also have details of covert roulette computers that predict where the ball will land with stunning accuracy. This is absolute fact, and they can be demonstrated to you personally. See www.roulettecomputers.com for details of this technology.
